Equity and Inclusion

Rhett D Harrison

Summary

The overall picture for equity and inclusion is broadly positive, though with important caveats. A substantial majority of FGD groups reported that the benefits of CFM are being shared equitably and that women benefit from CFM without disproportionately suffering opportunity costs. Notably, a majority of community female FGD groups themselves agreed that women have benefited from CFM. Carbon benefit-sharing agreements between carbon companies and communities are dominated by revenue sharing, while employment and livelihood support components are less commonly included. Responsibility for carbon income sharing decisions within communities was roughly equally split between instances where the CFMG executive makes the decisions and those where the whole CFMG is involved. Importantly, community female and youth FGD groups were significantly more likely than executive and male FGD groups to report inequitable benefit sharing, inadequate participation of women in decision making, and a lack of transparency in benefit sharing. In some CFMGs, community youth groups also identified issues with elite capture and marginalisation of youth. This common divergence in perspective between community members and CFMG executives is a concerning pattern suggesting that a minority of CFMGs have real equity problems that are not visible from the executive's perspective. Poor transparency in benefit sharing and the non-existence of grievance and redress mechanisms were also noted for many CFMGs. Without functioning formal channels through which equity concerns can be raised and addressed, inequitable outcomes risk going undetected and uncorrected. Strengthening these governance mechanisms is essential if CFM is to deliver equitable outcomes for all community members, including women, youth and other vulnerable groups.

Introduction

In this chapter, we consider the equitable sharing of benefits arising from community forest management (CFM) and what the impacts of CFM are on vulnerable groups.

Benefit sharing

We asked FGD groups whether the benefits of CFM were equitably distributed (Figure 1). On the one hand, a substantial majority of responses across the FGD groups asserted that benefits were being shared equitably. The proportion of community female and community youth groups that felt that benefits were not being shared equitably was significantly high than for the CFMG executive and community male FGD groups. Moreover, even among the CFMG executive and community male groups, there were some that agreed that benefits were not being shared equitably.

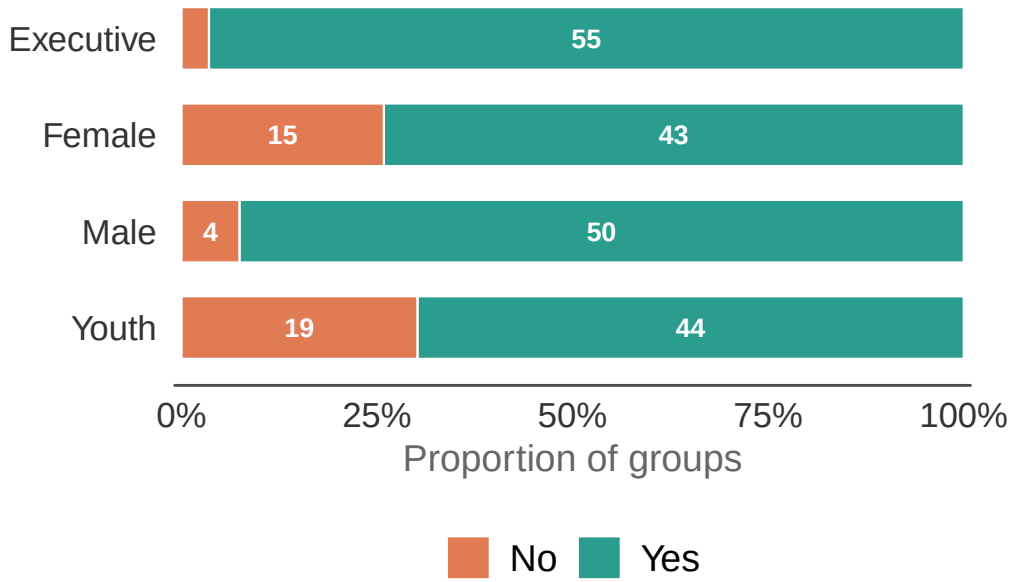

Figure 1: Are the benefits of CFM are equitably shared? The length of each bar segment represents the proportion of groups in that category. The numbers superimposed on the bars represent the actual number of groups in each category.

Equity - FGDs - Model methods

To examine differences among FGD types in whether they agreed the benefits of CFM were equitably shared, we employed a generalised linear mixed model (GLMM) with a binomial response and random intercepts for province and CF nested within province. We used FGD type as the factor. We examined the significance of pairwise differences among FGD types using Tukey HSD.

```
test.data <- cfmg |>
  filter(interview_type != "individual_interview") |>
  mutate(
    empl = economic_transformation_benefits_equity_across_groups,
    empl = case_match(empl,

Individual interviewees were also asked whether the benefits of CFM were equitably shared. Table 1 shows the percentage reporting this broken down by interviewee role. Again a substantial majority of respondents (83% - 92%) thought that benefits were being shared equitably, and the differences among respondents were not significant. However, there was still minority of respondents that did not think benefits were being equitably shared. This suggests that there are some CFs where the benefit sharing arrangements are not optimal or appropriate arrangements are not being followed.

Carbon income benefit sharing

Company-community arrangements

CFMG executive FGDs reported on the components were included in their carbon finance benefit-sharing arrangement with the carbon trading enterprise (Figure 2). Clearly the agreements are dominated by revenue sharing, with relatively few also containing agreements on employment, infrastructure development and livelihood support.

```r

```

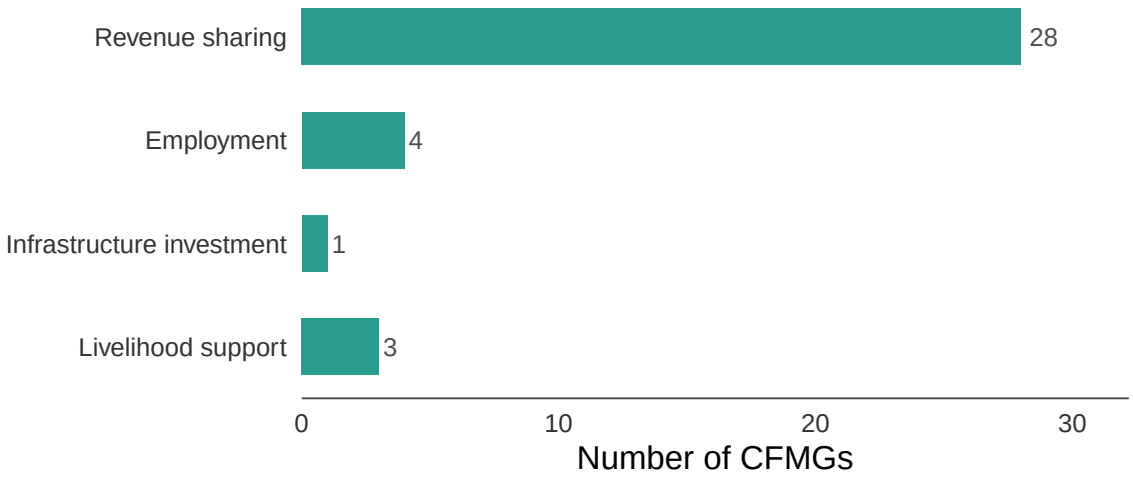

Figure 2: Components included in the carbon finance benefit-sharing arrangement between the carbon company and the community as reported by CFMG executive FGDs. The sample includes only those CFMGs that stated they had an agreement with a carbon trading company.

Within-community sharing

We also asked FGD groups about the carbon income sharing arrangements within the community. We first asked who is responsible for the decision-making (Figure 3) and then we asked on what principles the benefit sharing was based (Figure 4). As can be seen there is broad agreement among the FGD groups on who makes the decision about the caron benefit sharing arrangements. In approximately half the CFs the CFMG executive is responsible for the decision, while in the other half the entire CFMG is responsible.

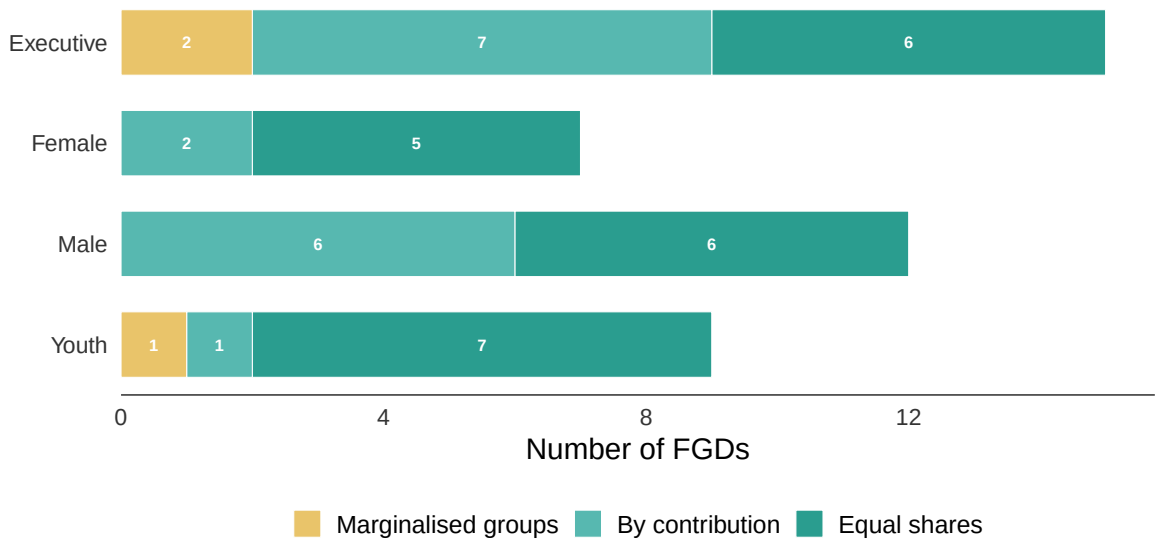

Figure 4: Principles governing carbon income sharing within the community by FGD group. The length of the segments is equal to the number of times that option was mentioned by the FGD group. Note: for 12 CFs the benefit-sharing arrangement is defined in the CFMG constitution.

According to the responses of the CFMG executives, seven CFs shared benefits acccording to members contribution to CFM while six shared them equally among the community households. Only two said that consideration of marginalised or vulnerable groups was a consideration. The other FGD groups were broadly similar in their responses and differences may be due to their knowledge of the arrangements, rather than actual differences in the arrangements.

External determination of benefit sharing

We also asked FGD groups whether stakeholders outside the community were also involved in determining the benefit-sharing arrangement (Figure 5).

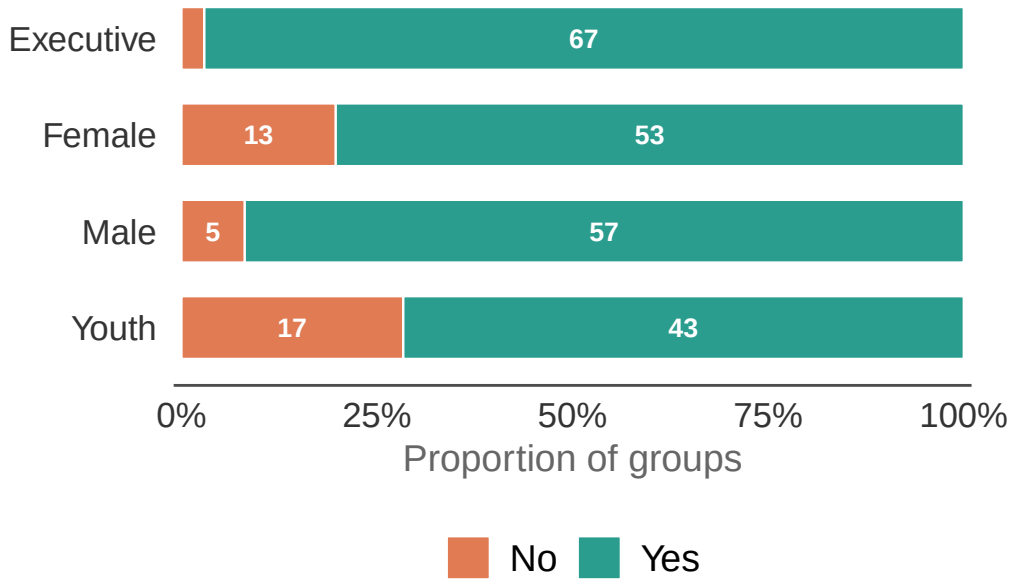

Figure 6: Do women benefit from CFM? The length of each bar segment represents the proportion of groups in that category. The numbers superimposed on the bars represent the actual number of groups in each category.

Women benefit from CFM - FGDs - Model methods

To examine differences among FGD types in whether they agreed that women benefit from CFM, we employed a generalised linear mixed model (GLMM) with a binomial response and random intercepts for province and CF nested within province. We used FGD type as the factor. We examined the significance of pairwise differences among FGD types using Tukey HSD.

```
test.data <- cfmg |>
  filter(interview_type != "individual_interview") |>
  mutate(
    empl = equity_and_inclusion_women_benefit_from_cfm,
    empl = case_match(empl,
                      "yes" ~ 1,
                      "no" ~ 0,
                      .default = NA),
    interview_type = factor(
      case_match(
```

```r
        interview_type,
        "cfmg_executive" ~ "Executive",
        "cfmg_female"    ~ "Female",

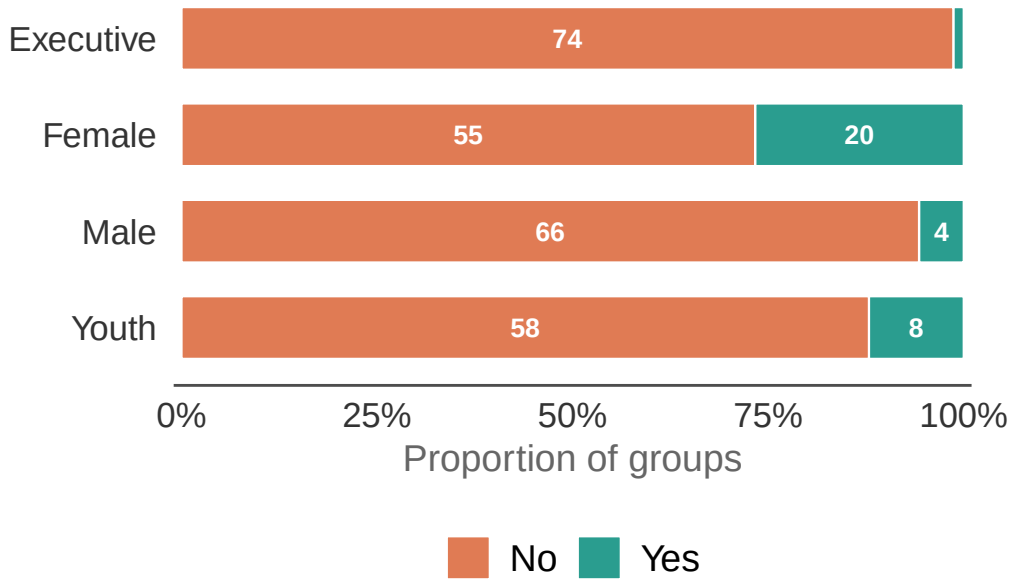

Figure 7: Do women disproportionately suffer the opportunity costs of CFM? The length of each bar segment represents the proportion of groups in that category. The numbers superimposed on the bars represent the actual number of groups in each category.

Women opportunity costs - FGDs - Model methods

To examine differences among FGD types in whether they agreed that women disproportionately suffer the opportunity costs of CFM, we employed a generalised linear mixed model (GLMM) with a binomial response and random intercepts for province and CF nested within province. We used FGD type as the factor. We examined the significance of pairwise differences among FGD types using Tukey HSD.

```
test.data <- cfmg |>
  filter(interview_type != "individual_interview") |>
  mutate(
    empl = equity_and_inclusion_women_disproportionally_suffer_opportunity_costs,
    empl = case_match(empl,

CFMG executive member	63	95%
Traditional leader	75	92%
District Forestry Officer	56	92%
NGO representative	32	97%

Women decision making - Individual interviewees - Model methods

To examine differences among individual interviewee roles in whether they agreed that women participate in CFM decision making, we employed a generalised linear mixed model (GLMM) with a binomial response and random intercepts for province and CF nested within province. We included interviewee role, interviewee gender and interviewee age as factors. To examine pairwise differences among interviewee roles, we employed Tukey HSD.

```
test.data <- cfmg |>

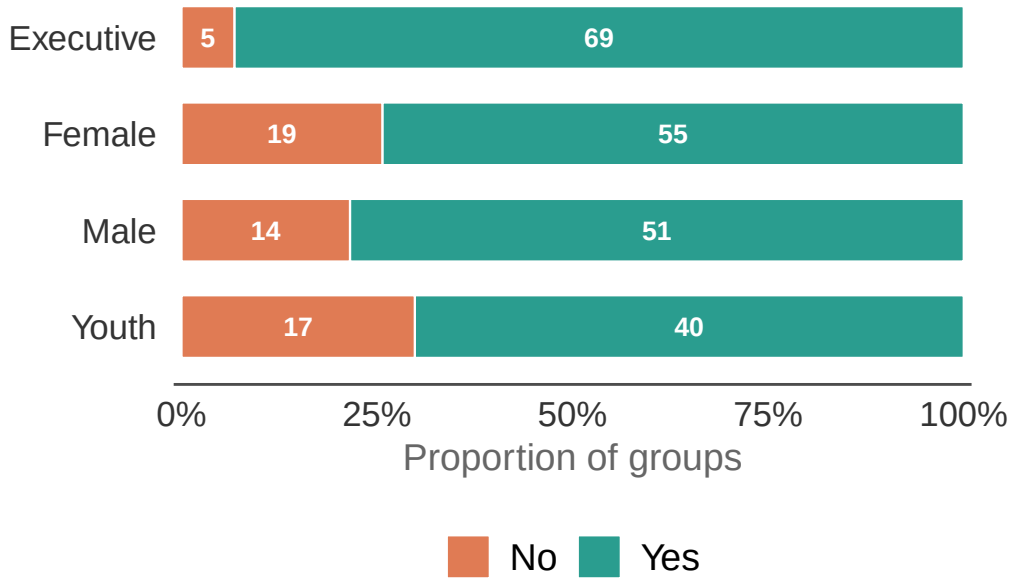

Figure 11: Does the CFMG have a grievance and redress mechanism? The length of each bar segment represents the proportion of groups in that category. The numbers superimposed on the bars represent the actual number of groups in each category.

Grievance and redress - FGDs - Model methods

To examine differences among FGD types in whether they reported having a grievance and redress mechanism, we employed a generalised linear mixed model (GLMM) with a binomial response and random intercepts for province and CF nested within province. We used FGD type as the factor. We examined the significance of pairwise differences among FGD types using Tukey HSD.

```r
test.data <- cfmg |>
  filter(interview_type != "individual_interview") |>
  mutate(
    empl = equity_and_inclusion_grievance_redress_mechanism,
    empl = case_match(empl,
                      "yes" ~ 1,
                      "no" ~ 0,
                      .default = NA),
    interview_type = factor(
      case_match(
        interview_type,
        "cfmg_executive" ~ "Executive",
        "cfmg_female"    ~ "Female",
        "cfmg_male"      ~ "Male",
        "cfmg_youth"     ~ "Youth"
      ),
      levels = c("Executive", "Female", "Male", "Youth")
    )
  ) |>
  drop_na(empl) |>
  mutate(province_cfmg = interaction(province, cfmg_name))

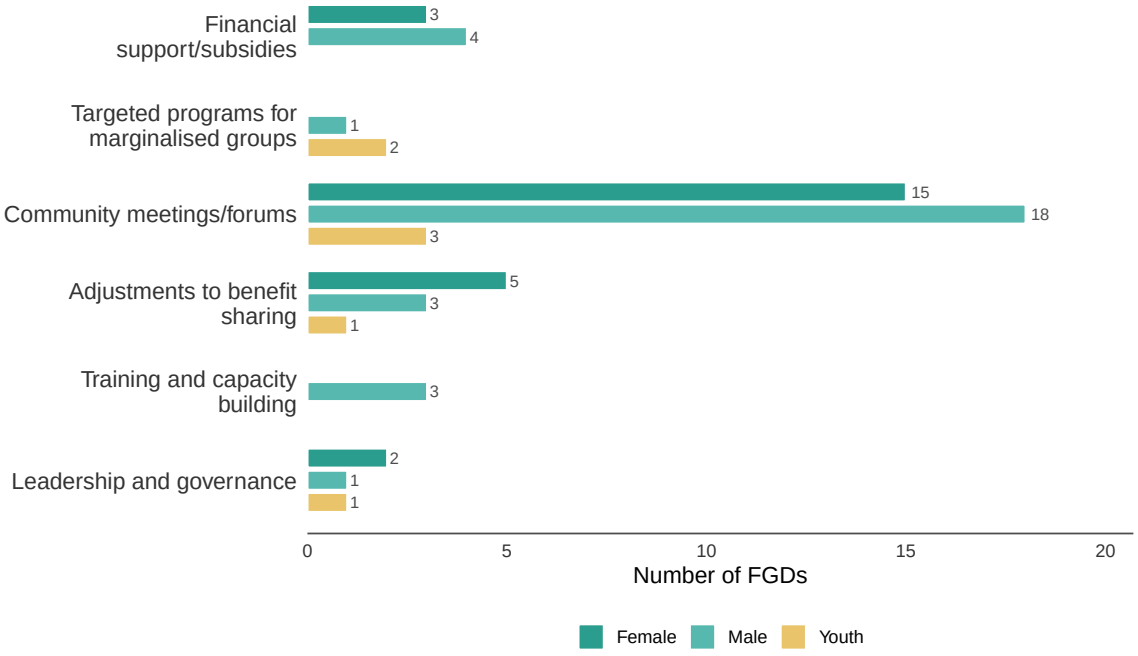

Figure 15: Suggested solutions to address barriers preventing poorer community members from benefiting from CFM, as reported by community female, male, and youth FGDs. Bars show the number of FGDs reporting each solution.

Discussion

Through the FGDs and individual interviews, we investigated a wide range of equity and inclusion indicators, covering benefit sharing, gender equity, transparency, grievance and redress, and poverty impacts.

The most striking and consistent finding is a divergence in perspective by FGD group. Across virtually every indicator — equitable benefit sharing, women benefiting from CFM, women suffering disproportionate opportunity costs, women's participation in decision making, and transparency in benefit sharing — community female and youth groups were significantly more likely than CFMG executive and male groups to report negative outcomes. Given that CFMG executives and community males may typically be better informed about formal governance arrangements, it is possible that this divergence reflects an information asymmetry rather than disagreement about conditions. However, it may also reflect that the benefits and costs of CFM are being distributed unevenly, in ways that are visible to female and youth community members but not acknowledged — or perhaps not noticed — by those in the CFMG executives. It is also possible that these differences in perspective reflect elite capture.

Notwithstanding these these issues, the overall picture is more positive than might have been expected. A clear majority of all FGD groups — including community female groups — reported that benefits are being shared equitably and that women benefit from CFM. Most female groups also stated that women do not disproportionately suffer opportunity costs and that women participate in CFM decision making. This is somewhat surprising, given that natural resource management decisions in Zambia are traditionally the purview of male community members. It may be that the formal governance structures mandated by CFM — CFMG elections, executive positions with female representation, and documented benefit-sharing arrangements — are providing women with a degree of recognition and voice that they would not otherwise have had.

Carbon benefit-sharing agreements between companies and communities are almost entirely structured around revenue sharing. Employment, infrastructure investment and livelihood support are less commonly included in these agreements. While revenue sharing provides a direct financial return, it means communities that have not yet received a carbon payment have little to show for CFM. Diversifying the components of company-community agreements could broaden both the distribution of benefits and community buy-in.

The reported poverty impacts of CFM — primarily increased household incomes and new income-generating activities — are broadly consistent with the economic transformation chapter findings. However, barriers to poorer community members benefiting remain, including limited access to resources, capital and markets. The solutions communities themselves proposed — financial support, targeted programmes for marginalised groups, and better governance — align closely with the governance and economic transformation recommendations identified elsewhere in this report.

In conclusion, the equity and inclusion outcomes of CFM in Zambia are broadly positive but uneven. The divergence between female and youth perspectives and those of CFMG executives is the most important finding of this chapter. It signals that equity problems in a subset of CFMGs are likely more widespread than executive-level data alone would suggest, and that strengthening transparency, grievance mechanisms and community-wide engagement is essential to ensuring CFM benefits reach all community members equitably.
